Mutat. 4:233-242(1994).

-!- FUNCTION: The lysosomal degradation of sphingolipids takes place by the sequential action of specific hydrolases. Some of these enzymes require specific low-molecular mass, non-enzymic proteins: the sphingolipids activator proteins (coprofeins).

-!- FUNCTION: Saposin A and saposin C stimulate the hydrolysis of glucosylceramide by beta-glucosylceramidase (EC 3.2.1.45) and galactosylceramide agalactosylceramide agalactosylceramide activates by combining with the enzyme and acidic lipid to form an activated complex, rather than by solubilizing

E. PUNCTION: "HE LYSOSOMAL DEGRADATION OF SPHINGOLIPIDS TAKES PLACE
BY THE SEQUENTIAL ACTION OF SPECIFIC HYDROLASES. SOME OF THESE
ENZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROPEINS:
THE SPHINGOLIPIDS ACTIVATOR PROTEINS (COPROPEINS) (BY SIMILARITY).

C. !- FUNCTION: SAPOSIN A AND SAPOSIN C STIMULATE THE HYDROLYSIS OF
GLUCOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
GALACTOSYLCERAMIDE BY BUTA-GALOGICERAMIDASE (EC 3.2.1.46).

SAPOSIN-C APPAREMILY ACTS BY COMBINING WITH THE ENYME AND ACIDIC
LIPPID TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBILIZING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: SAPESIN B STIMULATES THE HYDROLYSIS OF GALACTO-CEREBROSIDE SULFATE BY ARYLSULFATASE A (EC 3.1.6.8), GMJ GANGLIOGIDES BY BETA-CALACTOSIDASE (EC 3.2.1.23) AND GLOBOTRIADOSYLCERAMIDE BY APHA-GALACTOSIDASE A (EC 3.2.1.22). SAPOSIN B FORMS A SOLDHILIZING COMPLEX WITH THE SUBSTRATES OF THE SPHINGOLIPID HYDROLASES (BY SIMILARITY).

SPHINGOLIPID HYDROLASES (BY SIMILARITY).

SUBUNIT: SAPOSIN B IS A HOMODIMER (BY SIMILARITY).

SUBGINIT: SAPOSIN B IS A HOMODIMER (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Lysosomal.
-!- ALTERNATIVE PRODUCTS: At least 3 isoforms; sap-mu-0 (shown here),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-AUG-1992 (Rel. 23, Created)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This sequence represents an immunogenic peptide for a bi-specific antibody. The invention relates to a method of treating a bi-specific diseased tissues in a patient comprising administring a bi-specifically antibody (or fragment) having at at least 1 arm (A) that specifically binds a targeted tissue and at least 1 arm (B) that specifically binds a targeted lesson and at least 1 arm (B) that specifically binds a targeted lesson and at least 1 arm (B) that specifically binds in proteins are useful for pre-targetling methods of diagnosis and therapy. It is advantageous to raise bi-specific antibodies against a targetable conjugate that is capable of carrying at least 1 diagnostic or therapeutic agent. The characteristics of the chelator, metal chelate complex, therapeutic agent or diagnostic agent can be varied to accommodate differing applications without raising new bi-specific antibodies for each new application. The targetable conjugate is selected to elicit sufficient immune responses and also for rapid in vivo clearance when used within the bi-specific antibody targeting method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; frameshift mutant; T cell response; tumour; treatment; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present sequence represents a H2 homologue of a prolyl tripetididase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidyl-peptidase has an amidolythic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodonal disease such as gingivitis and periodontitis caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       equence encoded by the gene;

(iii) comprise 0-10 amino acid from the carboxyl terminus of the normal part of the protein sequence preceding the amino terminus of the mutant sequence preceding the amino terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant sequence and may further extend to the carboxyl terminus of the mutant in their full lengths or after processing by an antigen presenting cell (APC), T cell response.

The genes that the peptides are derived from, are characterised as antigen presenting cell (APC), T cell response.

The genes that the peptides are derived from, are characterised as susceptible to frameshiff mutation by having a mono nucleoside base repeat sequence of at least 5 residues, or a di-nucleoside base residues requence of at least 4 di-nucleoside base units. The peptides are created by the addition or deletion of 1 or 2 nucleoside base residues from the repeat sequence. The novel peptides and litit T cell responses and toxicity against tumours and cancer cells carrying genes with frameshift mutations. The novel peptides and DNA sequences can be used correct from the preparation of a composition for the treatment or prophylaxis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides AAV55684-Y66142 are fragments of mutant proteins arising from a frameshift mutation in a gene from a cancer cell. The peptides are characterised in that they:

(i) are at least 8 amino acids long and a fragment of a mutant protein arising from a frameshift mutation in a gene of a cancer cell; (ii) consist of at least one amino acid of the mutant part of a protein (ii) consist of at least one amino acid of the mutant part of a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Prolyl tripeptidyl-peptidase; amidolytic activity; periodontal disease;

T-cell receptor beta chain V-D-J region (111-1AG) - mouse (fragment)
C.Species: Mas musculus (house mouse)
C.Species: Mas musculus (house mouse)
C.Accession: Pr0628
R.Feeney, A.J.
R.Feeney, A.J.
A.Title: Junctional sequences of fetal T cell receptor beta chains have few N region: A.Fitle: Junctional sequences of fetal T cell receptor beta chains have few N region: A.Fitle: Junctional sequences of fetal R.Feeney A.Fitle: Junctional sequences of fetal R.Feeney A.F. Reference number: Pr0509; MUID:91277601
A.Accession: Pr0628
A.Status: translation not shown
A.Molecule type: mRNA
A.Molecule type: mRNA
A.Residues: 1-7 < FEE>
A.Experimental source: newborn thymus, strain BALB/c
C.Keywords: T-cell receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          T-cell receptor beta chain V-D-J region (111-1H) - mouse (fragment)
